

A vulnerability in the BazaarBuilder Shopping Cart component for Joomla!, which can be exploited by malicious people to conduct SQL injection attacks, has been reported.

Input passed via the "cid" parameter in index.php (when "option" is set to "com_prod" and "task" is set to "products") is not properly sanitised before being used in SQL queries. This can be exploited to manipulate SQL queries by injecting arbitrary SQL code.

This vulnerability is reported in version 5.0. Other versions may also be affected.
